

## **“Redefining sustainable yachting – a holistic approach based on green hydrogen propulsion”**

*“With its 68-foot motor catamaran “AQUON One”, the company Swiss Sustainable Yachts is pioneering the first leisure catamaran powered by green hydrogen. This allows zero-emissions yachting and, since AQUON One also produces its own energy from photovoltaic cells and generates green hydrogen directly on board, it has the potential to be energetically self-sufficient. In this webinar, the market development manager of the company will provide insights into this innovative energy system, as well as the implications it has on other aspects of the yacht design, such as hull and weight optimizations, implications on safety and classification, as well as a smart energy management system and sustainable building materials. Because redefining yachting to become more sustainable, truly requires a holistic new approach.*”
